Randomized number

$x_1 = [2, 5, 6, 8, 9, 10, 12, 13, 15, 20, 22, 23, 24, 25, 26] = 220$

Total number = 15

$\mu = 18$

Step 1 : Define the Null and Alternate Hypothesis

H_0 = The mean value from the sample and the predefined value does not differ

H_1 = The mean value from the sample and the predefined value differ significantly

Step 2 : Calculate the mean

$\bar{x} = \text{sum of the numbers} / \text{total number} = 220/15 = 14.67$

Step 3 : Calculate the sample standard deviation

No	x_1	$x_1 - \text{mean}$	$(x_1 - \text{mean})^2$

$$s = \sqrt{\sum (x_1 - \bar{x})^2 / n - 1}$$

$$= 30.18829795 / 15 - 1 = 2.156306997$$

Step 4 Calculate the test statistic (T)

$$T = (\bar{x} - \mu) / s / \sqrt{n}$$

$$= (14.67 - 18) / 2.156 / \sqrt{15}$$

$$= -0.3991374916$$

Step 5 : with Confidence level = 0.95, alpha=0.05, Find the T-Critical from T Table

The T-critical from the T table is 2.131

Step 6 Conclusion

The sample mean, 15 is hypothesized to be different from the expected mean, 18. The difference between the sample mean and the expected mean is not so big so it is not very significant. This means that H_0 is not wrong. Moreover, the t-statistic (-0.3991374916) is closer to 0 than the t-critical value (2.131). So, we can conclude that H_0 is correct.
